

NAT Policy:

In SmartConsole, go to **Security Policies > NAT** create new Object for **LAN-Subnet**

Navigate to **NAT** tab tick Add automatic address translation rules, translation method: **Hide**

Finally, LAN-Subnet NAT is configured automatically.

Publish & Install Policy:

To make your changes available to other administrators, and to save the database before installing a policy, you must publish the session. When you publish a session, a new database version is created. Before you publish the session, you can add some informative attributes to it. In the **SmartConsole** toolbar, click **Publish**.

When you select **Install Policy**, you are prompted to publish all unpublished changes. You cannot install a policy if the included changes are not published.

On the Global Toolbar, click **Install Policy**. The Install Policy window opens showing the installation targets (Security Gateways). From the Select a policy menu, select a policy package. Select one or more policy types that are available in the package. Select the **Install Mode**. **Install on each selected gateway independently** - Install the policy on each target gateway independently of others, so that if the installation fails on one of them, it doesn't affect the installation on the rest of the target gateways. Click **Install**.
